DETAILED ACTION

1. This Office Action is the answer to the Amendment filed on November 20, 2006, which paper has been placed of record in the file.
2. Claims 1, 3-6, and 8-12 are pending in this application.

Allowable Subject Matter/Reasons for Allowance

3. Claims 1 and 6 are allowed over the prior arts cited records.

The closets prior arts are:

1) Shigenaga (US 4,710,613) discloses an identification system wherein validity between a first unit and a second unit is identified when the first unit is electrically communicated with the second unit. The first unit includes a generator for generating identification code information, a calculator for calculating, based upon the identification code information, an estimation time required for processing the identification code information in the second unit, a time counter for measuring an actual time required for completely processing the identification code information in the second unit, and an unit for identifying validity between said first and second units by comparing the actual processing time to the estimation processing time. The second unit includes at least a processor for processing the identification code information sent from the first unit.

2) Lee (US 5,923,759) discloses a system for controlling requests from portable electronic cards of differing in-card electronic processing capabilities, and including a central processing module, associated memory, and an operating system, comprising a plurality of card units into which data cards and cards having internal data processing

may be inserted; security module means for authenticating cards inserted into the plurality of card units and for securely exchanging data with the authenticated cards; and means, separate from the security module means, for processing data received from the security module in accordance with an application program.

Therefore, it is clear from the description of Shigenaga's and Lee's inventions that the prior arts do not considered the possibility of: applying, in the untrusted authentication chip, a key one way function to the random number using a second secret key from the untrusted authentication chip to produce a second encrypted outcome, as included in claims 1 and 6.

4. Claims (3-5) and (8-12), are allowed because they are dependent claims of the allowable independents 1 and 6 above, in that order.

Conclusion

5. Claims **1, 3-6, and 8-12** are allowable.
